

English

1.

We will bring nature inside the room by creating a spatialized sonic composition with the sounds of wild animals, the wind, the river and the ocean.

To do so, we will use a sound library we prepared for you and will invite each participant to play the sound of their choice on their mobile phone.

2.

STEP 1: Let's form groups of at least 5 people. Each group will listen to the collection of sounds available on a Web page and talk for 10 minutes about what kind of forest we can build, if there is a river, where is the ocean ?

> capture this QR code to get the sounds

3.

STEP 2: We can now position our devices on the floor and play the sounds (by default in loop mode).

STEP 3: Let's walk this forest together for 5 minutes and close our eyes sometimes to feel the natural space.

4.

STEP 4: We analyze and understand the sound composition from the perspective of ecological intelligence. Every species belongs to a certain kind of environment and we can hardly listen to a frog in the ocean or a cicada in the middle of the river.
